

Gorilla Safety Seeks Advice on Its ELD Products

March 31, 2017

Gorilla Safety, a provider of patented software that automates fleet and safety management, announced today it is reviewing the current compliance model it uses to test its electronic logging device products.

“The company will be taking a look at its compliance and self-assessment processes, test results and test procedures performed by management, and is seeking advice” on how to improve them, it said in a statement. It wants input on how various upcoming requirements may become applicable to Gorilla Safety as their products continue to evolve.

The company has engaged KPMG LLP to conduct an objective assessment of its processes.

“Gorilla Safety is taking key steps to formalize the company’s compliance processes and embed testing and validation considerations into every software change,” the statement said. “The impact to the FMCSA compliance requirements is now formally evaluated for each contemplated enhancement and these considerations are embedded in how Gorilla Safety progresses each of these changes.”

Furthermore, Gorilla Safety stated that it is taking additional steps to continuously improve its compliance and self-assessment processes.
